Motivation

- In February 2022, the United States surpassed 1 million excess deaths since the start of the pandemic (National Center for Health Statistics [NCHS])
- Pandemic impacts are not distributed evenly across the population, but more heavily concentrated among:
 - Males
 - Older Americans
 - Hispanic, Non-Hispanic (NH) Black, and NH American Indian/Alaskan Native (AIAN) individuals
- Though consensus on racial/ethnic disparities is beyond dispute, estimates of the relative impacts of the pandemic vary...

Motivation

- For example:
 - Polyakova et al. (2021) estimate age-adjusted excess mortality for Non-Hispanic (NH) Blacks is **4.2 times greater** than that of NH Whites
 - Luck et al. (2021) estimate age-adjusted increases in death rates are only **2.5 times higher** for NH Blacks than NH Whites
- Variation in estimates of racial/ethnic disparities stems from differences in:
 - Measurement of race/ethnicity
 - Most of the literature relies on race/ethnicity as listed on death certificates
 - Next-of-kin reports or coroner assessments
 - Particularly poor for American Indian/Alaskan Natives (AIAN)*
 - Unreliable for Hispanics, Asians, and Native Hawaiian/Pacific Islanders (NHPI)*
 - Time period studied
 - Trade-offs between timeliness and comprehensiveness

Goals

- Provide circumspect estimates of excess mortality in the first full year of the pandemic, while also examining granular variation in mortality for population subgroups
 - Estimate age-, sex-, and race/ethnicity-specific excess *all-cause* mortality
 - Examine racial/ethnic gaps in excess all-cause mortality over the course of the pandemic and across the United States
- Inform ongoing research on the determinants of pandemic-era disparities

Measuring Mortality

- Census Numident (Q3 2021)
- Universe of individuals ever issued a Social Security Number (SSN)
- Reliable date of death information through March 31, 2021*
 - Death counts and trends virtually identical to those reported by NCHS

Measuring Demographic and Geographic Characteristics

- Age and Sex are also drawn from the Census Numident (Q3 2021)
- We use the most recent self-reported or household-proxy race/ethnicity response for each individual from the decennial census (2000, 2010) and the American Community Survey (ACS, 2001-2019)
 - Eight race/ethnicity categories following OMB (1997) standards:
 - Hispanic, NH White alone, NH Black alone, NH AIAN alone, NH Asian alone, NH Native-Hawaiian/Pacific Islander (NHPI) alone, NH Some Other Race (SOR) alone, and NH Multiple Race
- State of last known residence:
 - Decennial census (2010); ACS (2010-2019); Composite administrative record files (MAF-ARF, 2010-2020); and Third-party administrative data (2015-2020)

Linkage and Universe Restrictions

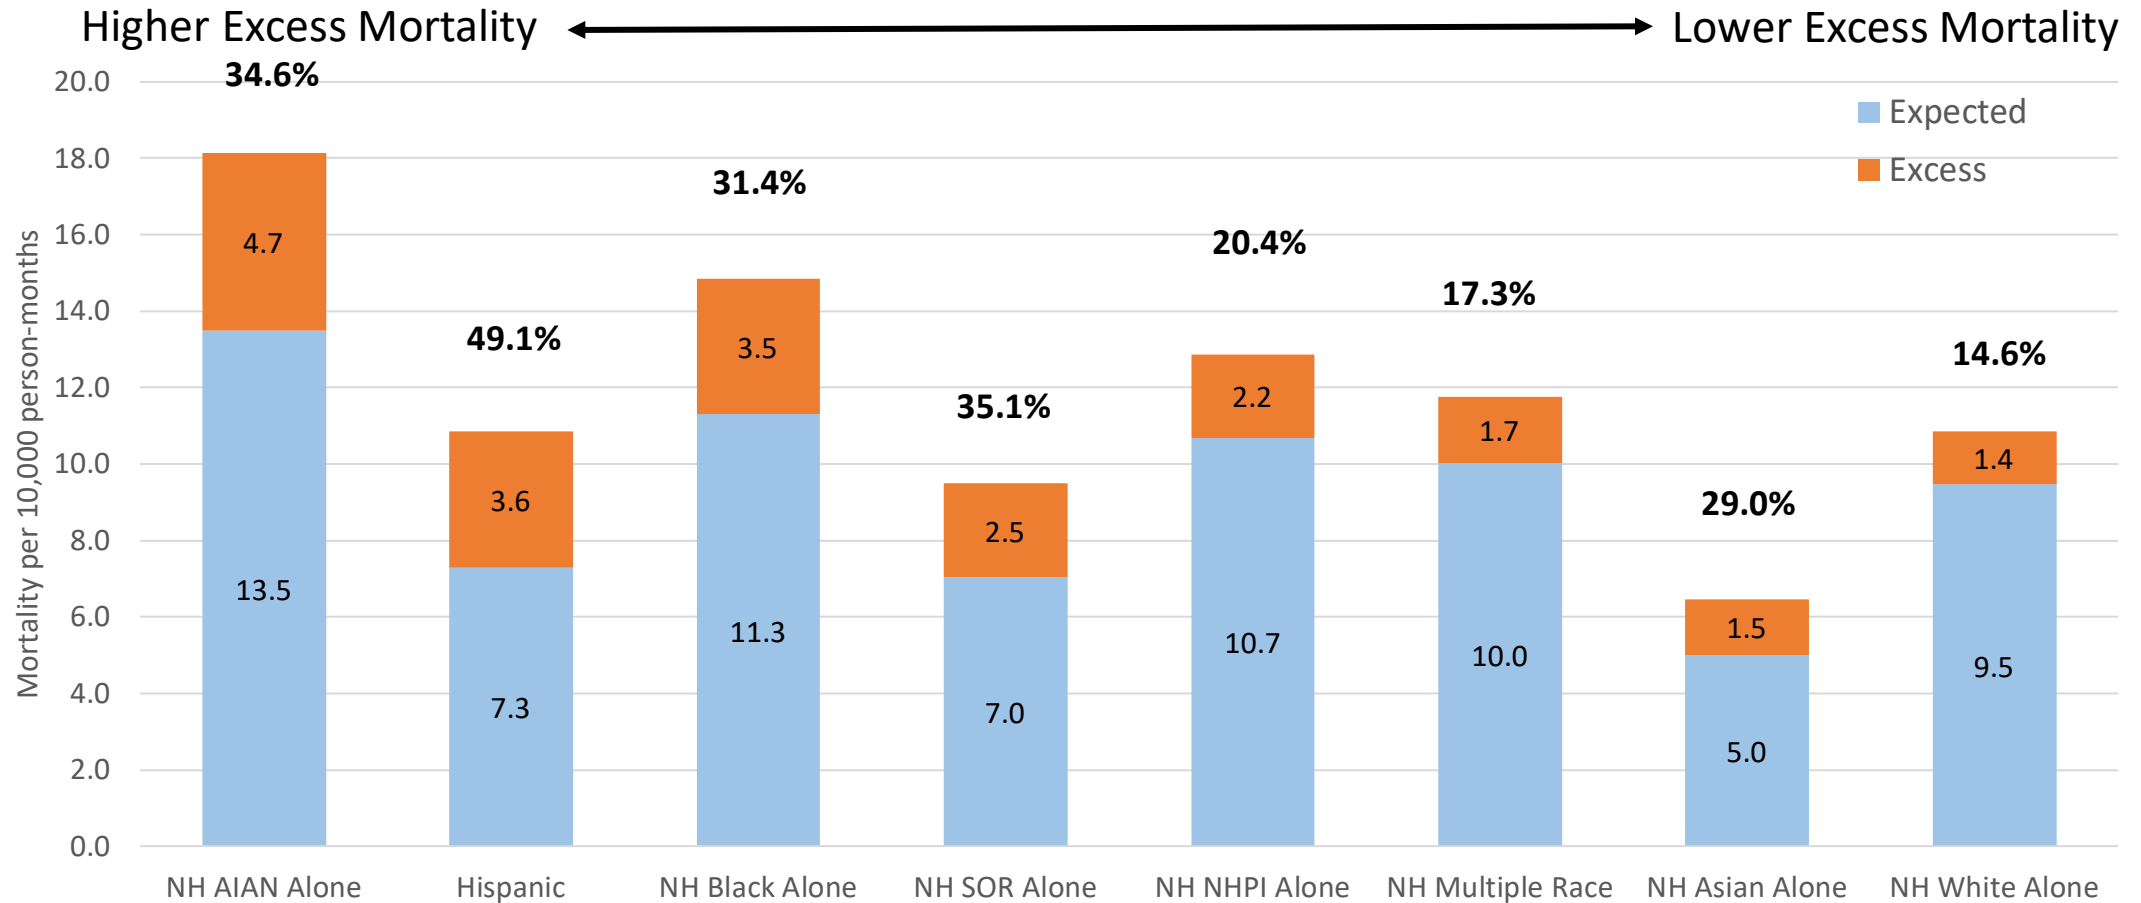

- We link individuals across datasets using anonymous Protected Identification Keys (PIKs) assigned by the Person Identification Validation System (PVS) software*
- The universe of all SSN-holders is restricted to those:
 - Alive as of April 1, 2010
 - With non-missing date of birth, sex, and race/ethnicity
 - Ages 15 to 99 (inclusive) at the start of a given month
- Analytical universe includes
 - 2.4 billion person-month observations in the April 1, 2010 to March 31, 2020 reference period
 - 248 million person-month observations in the April 1, 2020 to March 31, 2021 COVID period

Estimating Excess Mortality

- *Excess Mortality = Observed Mortality – Expected Mortality*
- *Expected Mortality* is the mortality rate expected in the hypothetical absence of the pandemic
 - Use negative binomial regression (with a population offset term) to predict expected death counts for the April 1, 2020 to March 31, 2021 period as a function of death counts from April 1, 2010 to March 31, 2020
 - Express these expected counts as deaths per 10,000 person-months

Age- and Sex-Adjusted Mortality

Age-, Sex-, and Race/Ethnicity-Specific Excess Mortality

Age-, Sex-, and Race/Ethnicity-Specific *Proportional* Excess Mortality

Temporal-Spatial Variation in Black-White Gap

First Full Year (April 1, 2020 through March 31, 2021)

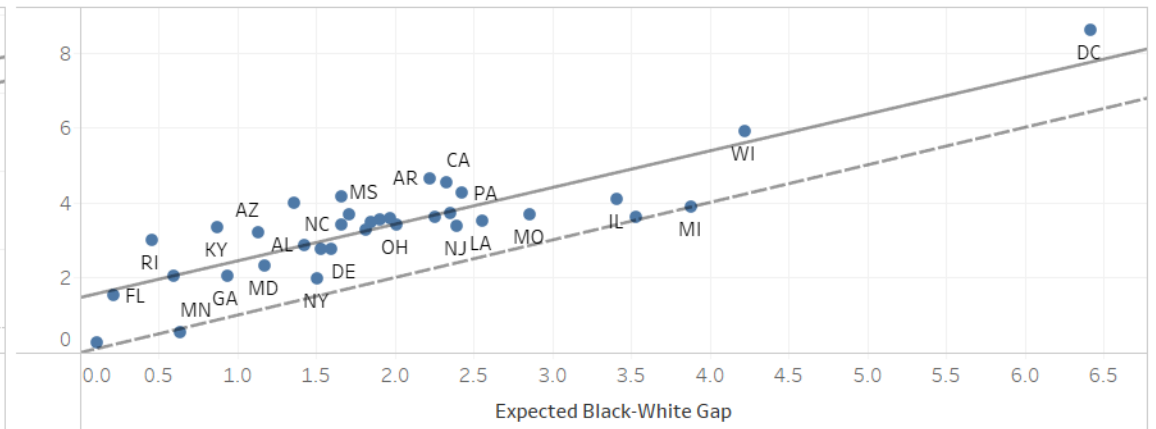

Wave 1 (April 1, 2020 through June 30, 2020)

Wave 2 (July 1, 2020 through September 30, 2020)

Wave 3 (October 1, 2020 through March 31, 2021)

Temporal-Spatial Variation in Hispanic-White Gap

First Full Year (April 1, 2020 through March 31, 2021)

Wave 1 (April 1, 2020 through June 30, 2020)

Wave 2 (July 1, 2020 through September 30, 2020)

Wave 3 (October 1, 2020 through March 31, 2021)

Discussion

- National excess mortality: 1.8 per 10,000 person-months (or 216 per 100,000 person-years)
- Adjusted excess mortality is lowest for NH Whites, but highest for NH AIAN, Hispanic, and NH Black individuals
 - Substantial racial/ethnic variation in excess mortality at younger ages
- Racial/ethnic disparities in excess mortality
 - Widened the Black-White mortality gap in virtually all states
 - Erased the Hispanic mortality advantage at the national level and, in many states, reversed the Hispanic-White mortality gap

Discussion

- Limitations
 - No cause of death information
 - Restricted to individuals ever issued an SSN
 - Substantial heterogeneity within the Hispanic racial/ethnic group
- Social and economic determinants of health as fundamental drivers of racial/ethnic disparities in excess mortality
- Properly understanding the origins of persistent racial/ethnic gaps requires accurate and detailed estimates of those gaps

Thank you!
